

Underground Recovery Plant Bernburg

Recovery process

1. Mining backfill mixtures with defined properties are produced above ground in a processing hall of our partner company AUREC GmbH, among other things by classification and conditioning.
2. The backfill materials are transported several hundred meters underground to an intermediate storage facility via a downpipe.
3. Vehicles are then used to transport the backfill material into the cavities. There, the backfill material is placed and covered with salt.
4. Delivery and backfilling of waste already packed in big bags is possible, if it meets the recovery requirements.

Bernburg site

- Recovery process: Tipping backfill
- Commissioning: 1992
- Acceptance of pneumatically conveyable waste, bulk goods, big bags
